The present sequence is a DNA encoding mouse Lats (large tumour suppressor) protein which is a cell overprollferation inhibitor and a negative regulator of cell cycle-dependent kinase cdc2/cyclin A.

The present sequence is useful for treating cancer that is refractory to standard chemotherapy or radiation therapy such as hyperplasia, metaplasia, or dysplasia, and disorders associated with aberrant levels of cdc2 activity. Conditions treated by promoting cdc2 function include degenerative disorders, growth deficiencies, hypoproliferative disorders, physical trauma, lesions, and wounds. An animal model prefarably a mouse, in which a lats gene has been disrupted by homologous recombination, e.g. a lats knock-out mouse, is used for screening compounds that can be used to treat or prevent cancer, particularly skin cancer, soft tissue sarcomas and ovarian tumours, and disorders shopponadotropic hypogonadism. The lats DNA is also used in gene therapy. 44; Fig 13; 134pp; English. Claim

XX

New isolated large tumour suppressor gene - used to develop prods.

PT for inhibiting cell proliferation or for enhancing proliferation

XX

XX

XX

XX

XX

This sequence encodes a mouse large tumour suppressor m-lats protein,

and has been isolated from a newborn mouse brain phage lambda-ZAP

CC CDNA library using a 2.2-kb DNA probe from the Drosophila lats gene

CC (AT42117). A homologous mouse sequence has also been isolated

CC (AT42117). A homologous mouse sequence has also been isolated

CC (AT42117). A homologous mouse sequence has also been isolated

CC (AT42117). A homologous mouse sequence has also been isolated

CC (AT42117). A homologous mouse sequence has look been isolated

CC (AT42117). A homologous mouse sequence has look been isolated

CC (AT42117). A homologous mouse sequence has look been isolated

CC (AT42117). A homologous mouse sequence or inhibitors of caterial role throughout development. Activators or inhibitors of late fragment) may be used in therapy of cancer or other.

CC lates fragment by eused in therapy of cancer or other.

CC deficiency, etc., and fragments of the gene may be used as diagnostic probes. A lats-inhibitor sequence may be expressed in a transgenic probes. A lats-inhibitor sequence may be expressed in a transgenic senescence:

(AAT42119). The full-length cDNA is present in plasmid pBS(KS)-h-lats. The gene encodes a putative protein serine/threonine-kinase, and inhibits cell proliferation and plays a crucial role throughout development. Activators or inhibitors of lats function (e.g. an antisense oligonuclectide or dominant-negative lats fragment) may be used in therapy of cancer or other proliferative disorders, degenerative disorders, trauma, growth deficiency, etc., and fragments of the gene may be used as diagnostic probes. A

The present sequence is a DNA encoding human Lats (large tumour suppressor) protein which is a cell overproliferation inhibitor and angative regulator of cell cycle-dependent kinase dcd2/cyclin A. The present sequence is useful for treating cancer that is refractory to standard chemotherapy or radiation therapy such as hyperplasia, metaplasia, or dysplasia, and disorders associated with aberrant levels of cdc2 activity. Conditions treated by promoting cdc2 function include degenerative disorders, growth deficiencies, hypoproliferative disorders, physical trauma, lesions, and wounds. An animal model preferably a mouse, in which a lats gene has been disrupted by homologous recombination, e.g. a lats knock-out mouse, is used for screening compounds that can be used to treat or prevent cancer, particularly skin cancer, soft tissue sarcomas and ovarian tumours, and disorders

nucleotide 978, resulting in an Ala/Gly change; (2) at nucleotide 1840, silent; and (3) at nucleotides 3252-3253, comprising a deletion of 2 adenosines, resulting in a c-terminal truncation of mutation was observed in 2 independent clones from human bone marrow cDNA. Truncation of hWART1 could play a role in disease progression. hWART1 shows strong expression in cell lines from non-small cell lung cancer, ovarian tumours, central nervous system tumors, renal tumours and breast tumours, and may provide a target for oncology drug development. Nucleic caids encoding full-length hWART1 and hWART1 polypeptides lacking one or more of amino acid segments 12.45, 55-151, 336-377, 404-520, 555-559, 601-702, 691-998 and 1011-1066, or lacking one or more of the N-terminal domain, catalytic domain, or C-terminal domain are claimed, as well as MARRY Sequences (AAX87397), NAMRIT and NAMRIZ DOTYPEPTIGES, antibodies, a method for identifying modulators of NAMRT function, and use of such modulator compounds to treat an abnormal condition involving hWART signal transduction, especially cancer. detection of hWART nucleic acids are also claimed.

The invention relates to a human warts protein, homologous to Drosophila warts gene expression product. The warts expression product is a protein kinase involved in the regulation of proliferation and differentiation of epithelial calls and suppression of tumour formation. The gene, its expression product and antibodies are useful in the study of the mechanisms of tumour development. The present sequence represents a DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a human warts protein, homologous to Drosophila warts gene expression product. The warts expression product is a protein kinase involved in the regulation of proliferation and differentiation of epithelial cells and suppression of tumour formation. The gene, its expression product and antibodies are useful in the study of the mechanisms of tumour development. The present sequence represents a human warts gene fragment encoding a partial peptide fragment.

Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer

Claim 1; Page 554-555; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides.

To polypeptides in a sample, and methods of identifying compounds which the notypeptides of the invention. Although novel, many of the nucleotides polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence giving an insight into their probable biological activities, and hence giving an insight applications. The polypeptides of the invention may have various activities; stem cell growth factor activity; have various activities; stem cell growth factor activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; activin or inhibin related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombotytic activities; or may be

involved in oncogenesis, cancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, heamatopoletic discorders (e.g., myelolid or lymphoid cell cancers, heamatopoletic discorders (e.g., myelolid or lymphoid cell cancers, heamatopoletic discorders (e.g., myelolid or lymphoid cell proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischemina, bone disorders (e.g., osteoporosis), and abnormal vacular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound health in functions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.

Colypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuropithalial cells may be used in cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä
                                                                                                                                                                                                                                                                                                                               that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides and may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1902 AAATCTGGCACGATTCTACATAGCAGAACTTACCTGTGCAGTTGAAAGTGTTCATAAAAT 1961

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein, and has been isolated from a newborn mouse brain phage lambda-ZAP CDNA library using a 2.2-kb DNA probe from the Drosophila lats gene (AAT42117). A homologous mouse sequence has also been isolated (m-lats, AAT42119). The gene encodes a putative protein-serine/threonine-kinase, and inhibits cell proliferation and plays a crucial role throughout development. Activators or inhibitors of lats function (e.g. an antisense oligonucleotide or dominant-negative proliferative disorders, degenerative disorders, trauma, growth deficiency, etc., and fragments of the gene may be used as diagnostic probes. A lats inhibitor sequence may be expressed in a transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GACCTGGACAGCCTGTGCACCAGTGTGCAGCAGAGTCTGCGAGGGGGCACTGATCTAGAC 1344

actory to treatment by standard chemotherapy and radiation disorders associated with aberrant levels of cdc2 activity refractory and

Pages 112-117; 134pp; English 44: Claim

The present sequence is a DNA encoding mouse Lats2 (large tumour suppressor) protein which is a cell overproliferation inhibitor and a negative regulator of cell cycle-dependent kinase cdc2/cyclin A.

The present sequence is useful for treating cancer that is refractory to standard chemotherapy or radiation therapy such as hyperplasia, or dysplasia, and disorders associated with aberrant levels of cdc2 activity. Conditions treated by promoting cdc2 function include degenerative disorders, growth deficiencies, hypoproliferative disorders, physical trauma, lesions, and wounds. An animal model preferably a mouse, in which a lats gene has been disrupted by homologous recombination, e.g. a lats knock-out mouse, is used for screening compounds that can be used to treat or prevent cancer, particularly skin cancer, soft tissue sarcomas and ovarian tumours, and disorders associated with pituitary dysfunction e.g. luterhizing hormone (LH) hypogonadotropic hypogonadism. The lats DNA is also used in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence of a cDNA clone coding for a human crthologue, i.e. hWART2 (see AAY06527), of Drosophila non-receptor serine/threonine kinase WART. hWART2 cDNA was-isolated from a human bone marrow cDNA library using a PCR fragment of hWART1 as probe. hWART2 is consistently expressed in human tumour cells lines, exceptfor most of the colon cancer lines examined. This coverexpression in tumour cells ormal tissues may provide a target for oncology drug development. Nucleic acids encoding full-length hWART2 polypeptides lacking one or more of anion acid segments 1-33, 43-139, 342-466, 467-480, 514-518, anion acid segments 1-33, 43-139, 342-466, 467-480, 514-518, anion acid segments and by Antion one or more of the Natronal domain, catalytic domain, or Cateninal domain are claimed, as well as hwart1 sequences (AAX87396), hWART2 and hWART1 polypeptides. Catalytic domain, or Cateninal domain are claimed, as well as antibodies, a method for identifying modulators of hWART function, and use of such modulator compounds to treat an abnormal condition involving hWART signal transduction, especially cancer. Probes for detection of hWART nucleic acids are also claimed.

New human growth hormone inhibited tumour diagnosis of dwarfism, gigantism, acromega

Claim 1; Page 28-39; 59pp; English.

nephropathy or cardiopathy

1220 CAGTAAGTAAGCCCTGCAAAGATGAACAGCCTAGCTTACCCAAGGAAGATGATAGTGAGA 1279 1999 CAGGCATGGAGCAGAGCCTCCGTGCGGGCCCCAACGAGCCCGAGGGCGGCGACAAGAGCC 2058 The present sequence encodes a human growth hormone inhibited tumour suppressor (hGHITS) protein. The hGHITS proteins can be used in an antineoplastic pharmaceutical preparation. Probes for the hGHITS DNA sequences can be used in diagnostic pharmaceutical preparations. The diagnostic pharmaceutical preparations can be used for examining expression of hGHITS genes in dwarfism, gigantism, acromegaly, angiopathy, diabetic nephropathy or cardiopathy, or in malignant tumours including breast cancer, renal adenocarcinoma, colorectal cancer, and leukaemia. Antibodies against the proteins can be used in diagnostic pharmaceutical preparation for examining expression of 2059 GCAAAAGCGCCAAGGGGGACAAAGGCGGAAAGGATAAAAAGCAGATTCAGACCTCTCCCG AGCAGCGTCTGCATCGGAAGAAGCAGCTAGAAAATGAAATGAAATGCGGGTTGGATTATCTC 1340 TCACTGTTCGGAAAAAAAAAAAAAGATGAAGAACGAAAGAAGAGTCTCGGATTCAGAGTTACT CCCCACAGGCCTTTAAGTTCTTCATGGAGCAGCACGTAGAGAACGTCCTGAAGTCTCATC DB 21; Length 5486; Sequence 5486 BP; 1380 A; 1451 C; 1388 G; 1267 T; 0 other; Indels Score 787.2; DB 21; Pred. proteins having kinase activity. The kinase polypetides and fragmented polypeptides are used as molecular weight and isoelectric focusing markers, and as controls for peptide fragmentation. They also have a number of therapeutic uses as kinases play a central role in cellular signal transduction. The polypeptides could also be used to identify binding partner proteins. The polypeptides can also be used a reagent to identify any proteins that the polypeptide requiates, and proteins with which it might interact. The polypeptides may also be used for preparation of antibodies. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein by immunoaffinity chromatography.

Sequence 6, Application US/08860150B
Patent No. 5991205
GENERAL INFORMATION:
APPLICANT: Hemmings, Brian A.
APPLICANT: Homes A.
TITLE OF INVENTION: Nuclear DBF2-Related (NDR) Kinases
FILE REFERENCE: 4.20265/APCT
CURRENT APPLICATION NUMBER: US/08/860,150B
EARLIER FILING DATE: 1997-06-19
EARLIER PLICATION NUMBER: PCT/EP95/05052
EARLIER PLICATION NUMBER: PCT/EP95/05052
SOFTWARE: PatentIn Ver. 1994-12-22
NUMBER OF SEQ ID NOS: 18
SEQ ID NO 6
